easy (1.2)

"Skip Counting" is a technique to teach multiplication tables. The idea is to *skip* some numbers while *counting*, such as starting at 0 and counting by 5's (but not reciting the 0): 5, 10, 15, 20, Students may form a circle and take turns reciting the successive numbers.

Your task is to write a program to help a student learn to skip count by using a number they enter. Your program will be given an integer, and it should print out the first 12 multiples of that number, each on a separate line.

Input

There will be a single positive integer on the input line. This number will never be more than 1,000,000.

Output

Display the first 12 multiples of the given number, one per line.

Sample Input 1

5

Sample Output 1

5
10
15
20
25
30
35
40
45
50
55
60
